

## **Use Oriented Manual for Statistical Analyses and Interpretation of water Quality Data**

### **Foreword**

For formulating rational policies for pollution control, besides preparation of basin and sub-basin inventories, the Central Board in collaboration with the State Pollution Control Boards started generating water quality data through the monitoring of various water resources. For management of data uniformly, certain guidelines are desirable to be evolved. The present manual is a step towards the rationalisation of water quality data processing, analysing and interpretation. It is hoped that the manual will be useful to State Pollution Control Boards and other users in generating uniform water quality data.

The manual was drafted by Dr. P.M. Modak, Consultant, which was scrutinised, edited and put into the present shape by Smt. Usha Ghosh.

Any suggestion to improve the manual will be appreciated.
